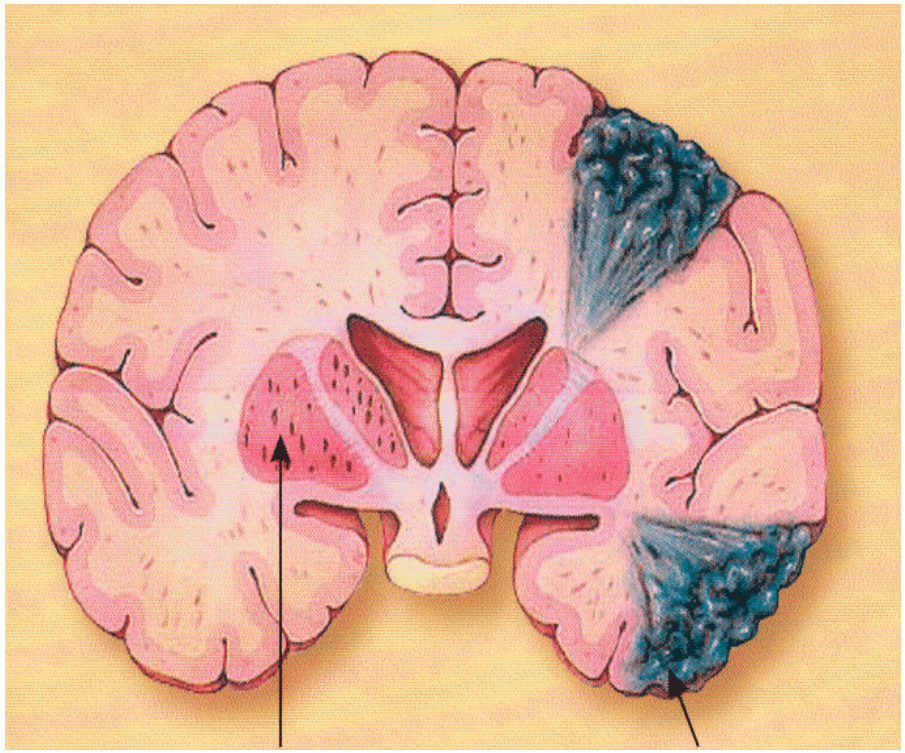
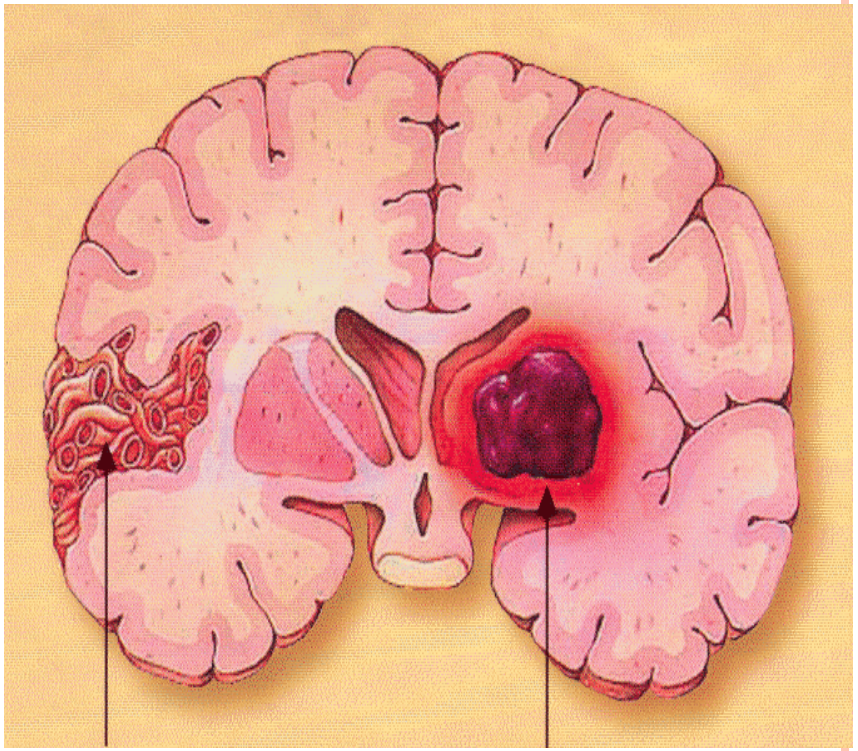
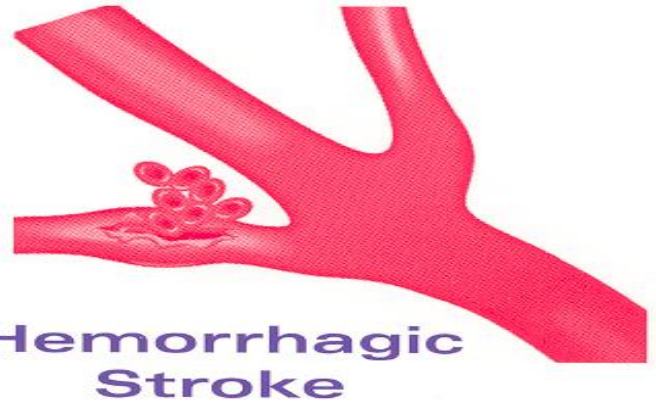
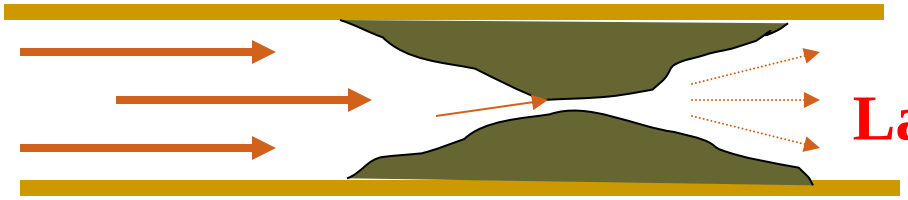
Stroke Subtypes



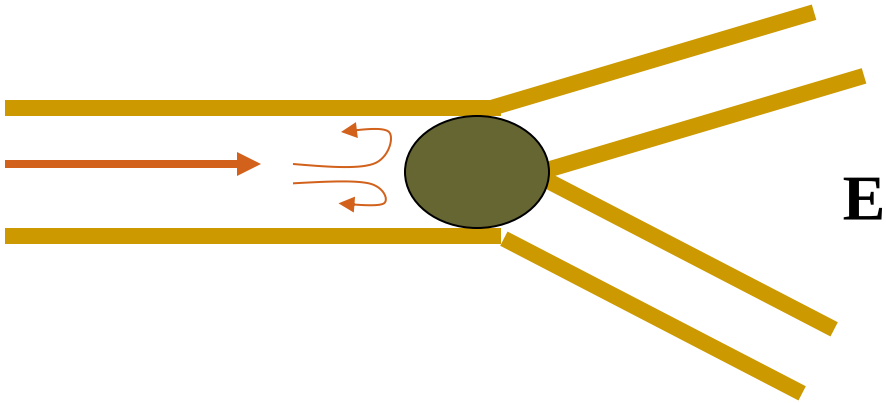




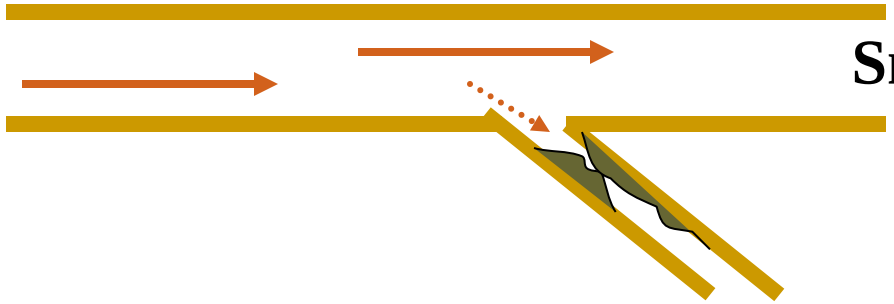
Classification of Ischemic Stroke



Large artery atherothrombosis

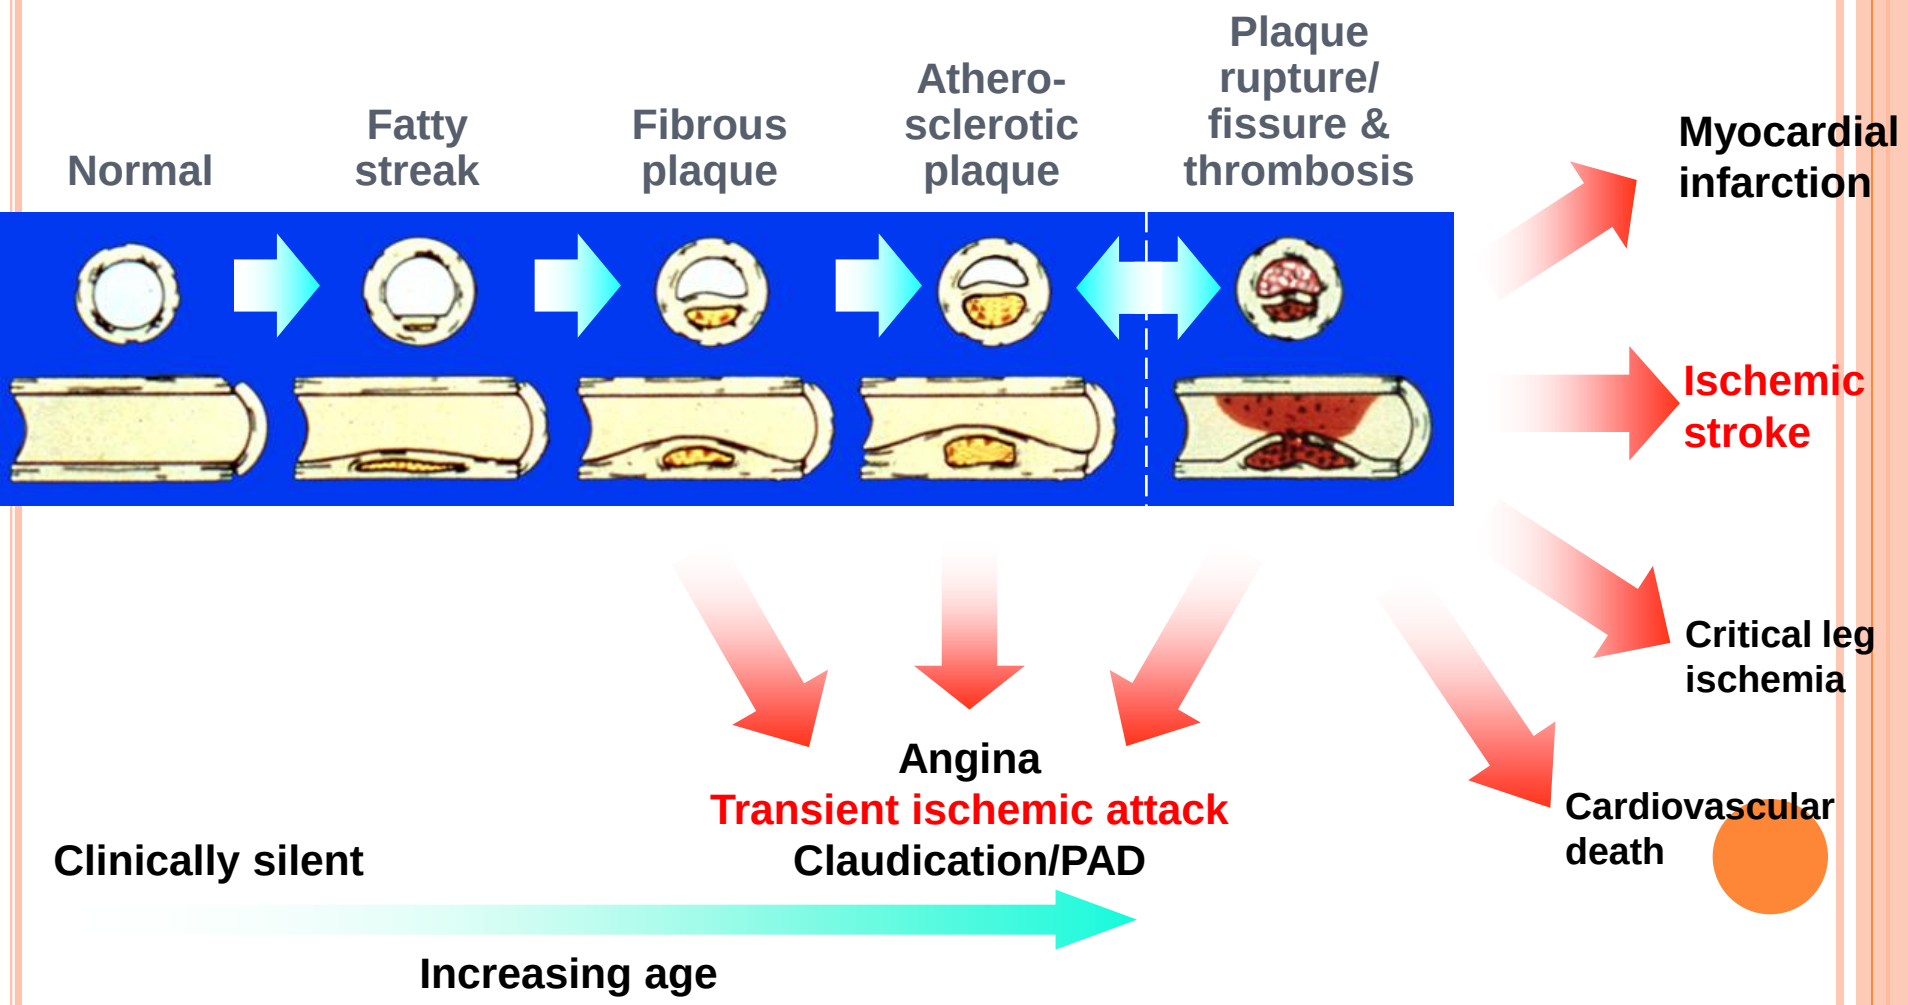


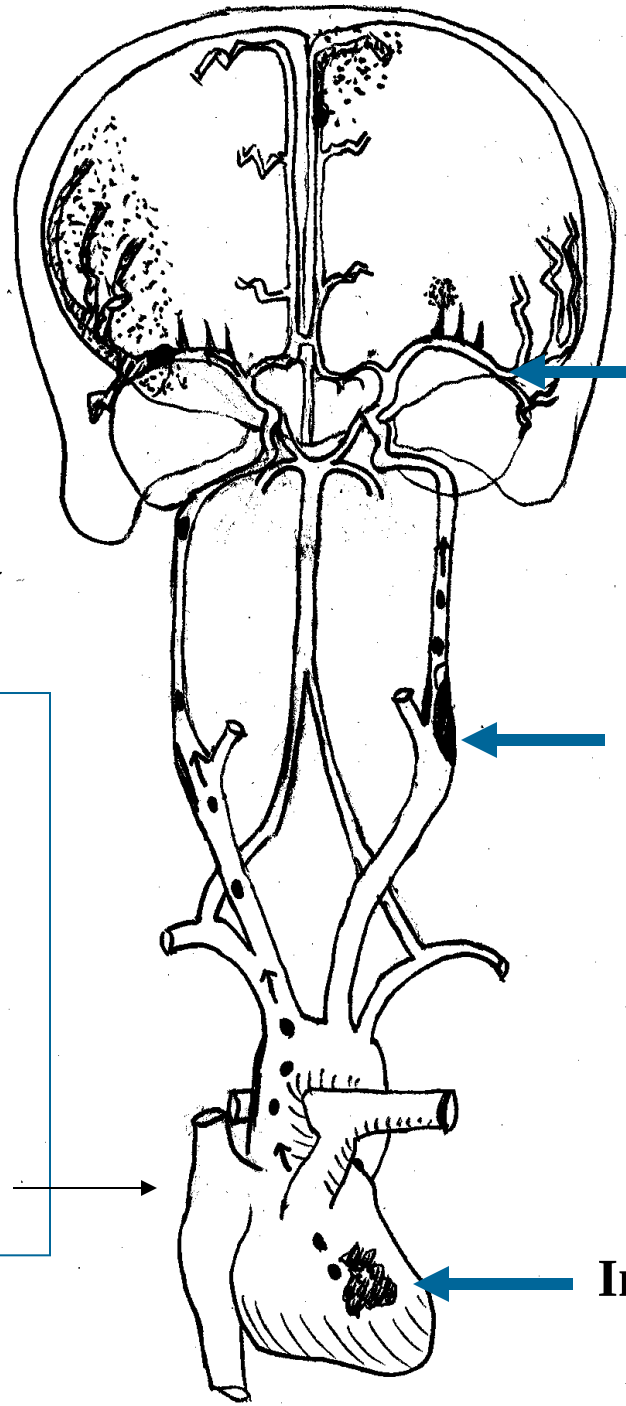
Embolic stroke



Small artery occlusion

Atherothrombosis: a Progressive Process

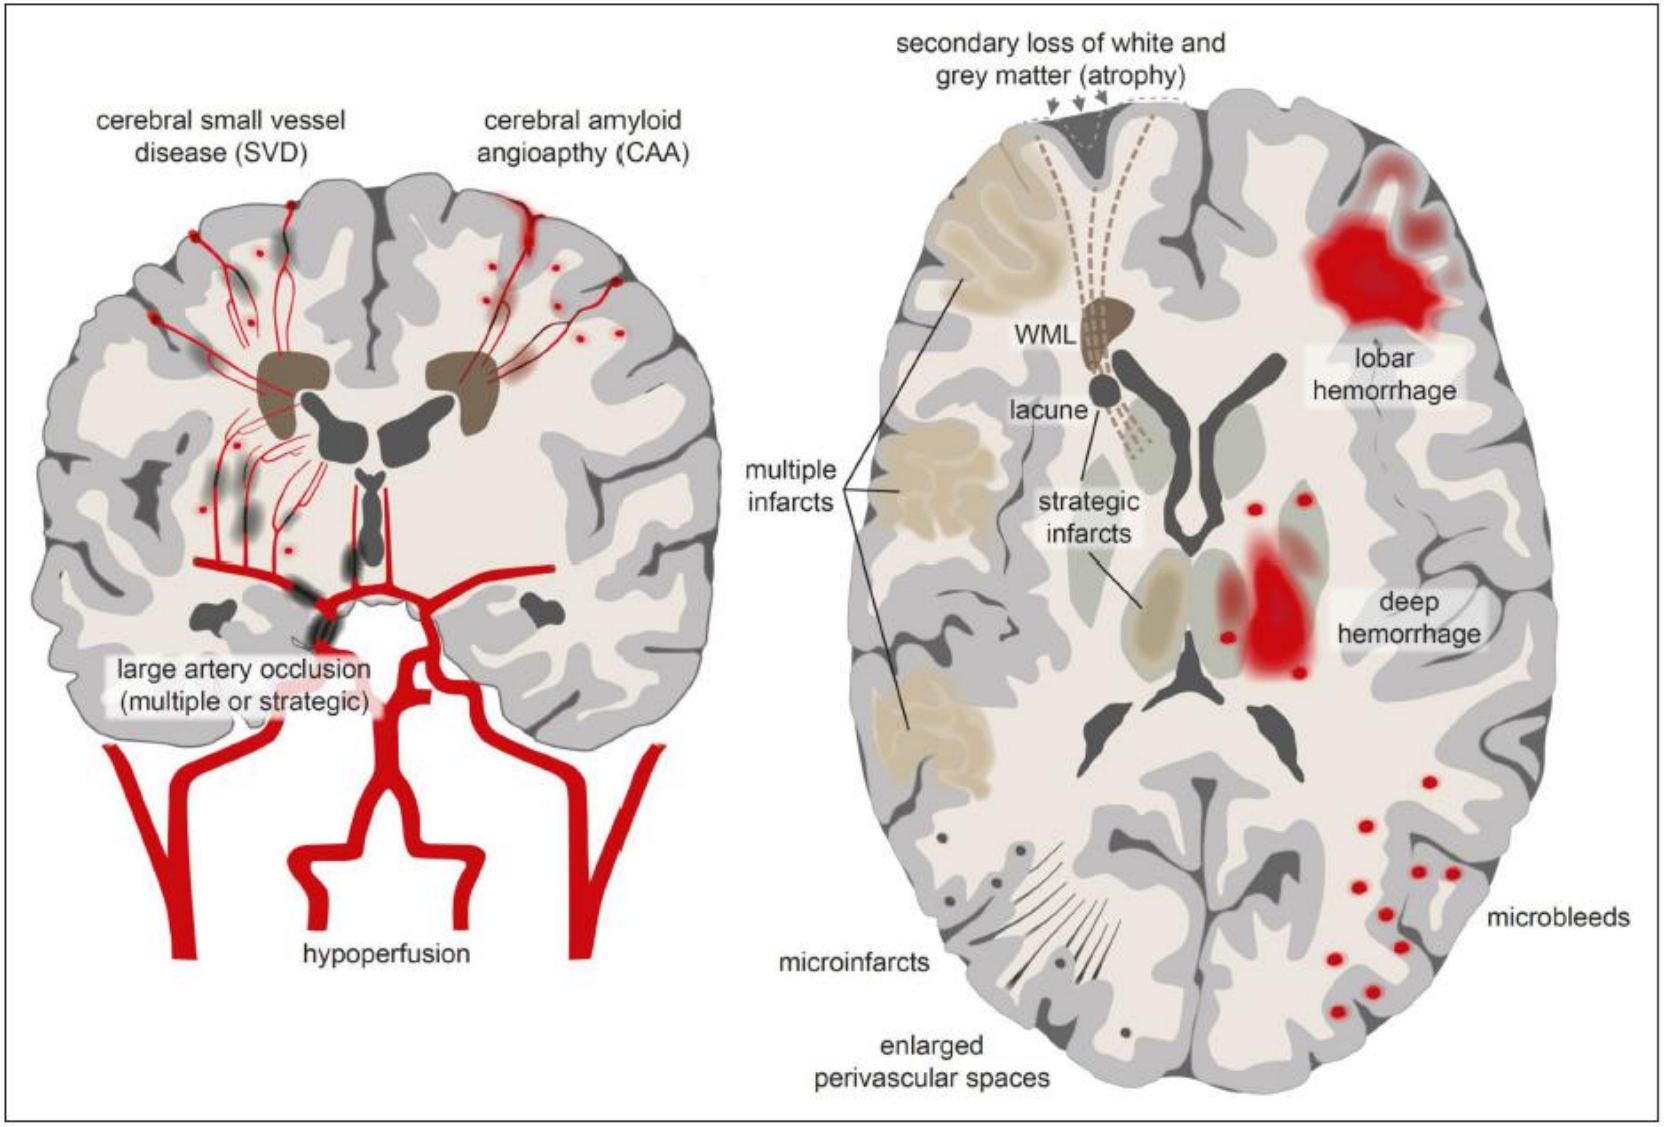




Heart Disease

1. **AF**
2. **VHD**
3. **Cardiomyopathy**
4. **Coronary disease**
5. **Septum defect**

Small Vessel Disease: HT, smoking, gene..



***Circulation Research*. 2017**

Other specific causes of ischemic stroke

Coagulopathy
- Protein C
  - *arterial infarct*
  - *cerebral venous thrombosis*
- Protein S
  - *arterial infarct*
  - *cerebral venous thrombosis*
- Polycythemia vera
- Antiphospholipid syndrome
- Trousseau's syndrome
- Idiopathic thrombocytopenic purpura
- Aplastic anemia
- Hemolytic anemia
- Myeloproliferative disorder
- Leukemia or lymphoma

Dissection
- VA dissection
- ICA dissection
- MCA dissection
- CCA dissection due to aortic arch aneurysm

Post-irradiation vasculopathy

Nephrotic syndrome

SLE with or without nephrotic syndrome

Cerebral venous thrombosis

Giant aneurysm

Infection
- Syphilis
- Tuberculosis
- Cryptococcus
- Mucomycosis

Migrainous stroke

Arteritis
- Isolated CNS angitis
- Takayasu's arteritis
- Moyamoya disease

Hypereosinophilic syndrome

Hypovolemic shock

Post-trauma infarct

Genetic disease: MELAS/CADASIL

Behcet's disease

Post-renal transplant

Cryptogenic Stroke

- Brain infarction that is not attributable to a source of definite CE, LAA, SVO despite a standard vascular, cardiac, and serologic evaluation.

- **Stroke of undetermined etiology**
  - **Two or more causes identified**
  - **Negative evaluation**
  - **Incomplete evaluation**

Statin Treatment in Patients With Intracerebral Hemorrhage

Matthias Endres, MD; Christian H. Nolte, MD; Jan F. Scheitz, MD

Ever since the publication of the SPARCL trial (Stroke Prevention by Aggressive Reduction in Cholesterol Levels) in 2006, neurologists became aware of the fact that statins may increase the risk for future intracerebral hemorrhage (ICH) in patients with previous ischemic stroke or ICH.[1,2] At the same time, observational studies reported an increased risk for hemorrhagic transformation or even symptomatic bleeding in ischemic stroke patients undergoing thrombolysis who were pretreated with statins.[3,4] As a con-

Statin Therapy and ICH Risk

~ A Meta-analysis Of 31 Randomized Controlled Trials

- 91,588 subjects in active group and 91,215 in control group.

- No significant difference in incidence of ICH (OR, 1.08; 95% CI, 0.88 –1.32; P=0.47).
  - ICH risk was not related to the degree of LDL reduction or achieved LDL cholesterol.
  - Decrease in total stroke (OR, 0.84; 95% CI, 0.78–0.91; P<0.0001) and all-cause mortality (OR, 0.92; CI, 0.87– 0.96; P=0.0007).

Stroke. 2012;43:2149-56.

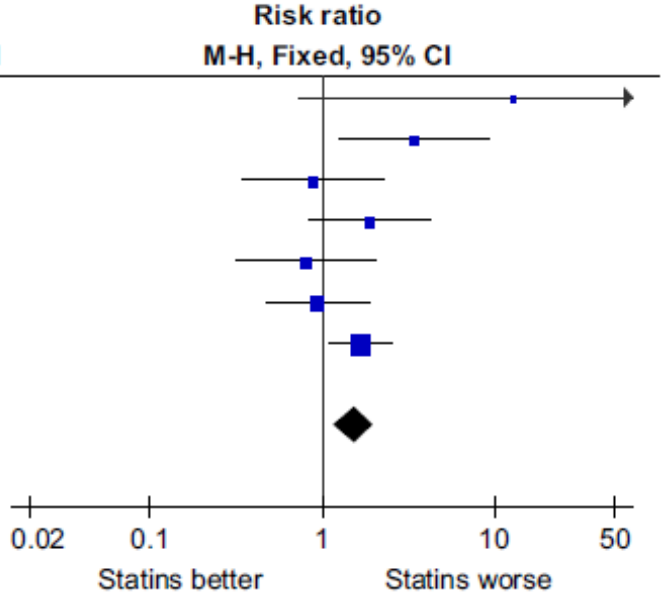
High-dose Statin Therapy and ICH Risk

- High dose of statins was defined as atorvastatin 80 mg, simvastatin 80 mg, pravastatin 40 mg, rosuvastatin 20 mg per day.
- Seven RCTs involving 31,099 subjects receiving high-dose statin and 31,105 subjects.

	Active		Control			Risk ratio
Study or subgroup	Events	Total	Events	Total	Weight	M-H, Fixed, 95% CI
ATOZ 2004	6	2265	0	2232	0.6%	12.81 [0.72, 227.27]
ALLHAT 2002	17	5170	5	5185	6.0%	3.41 [1.26, 9.24]
JUPITER 2008	8	8901	9	8901	10.8%	0.89 [0.34, 2.30]
LIPID 1998	17	4512	9	4502	10.8%	1.88 [0.84, 4.22]
PROSPER 2002	8	2891	10	2913	11.9%	0.81 [0.32, 2.04]
TNT 2005	16	4995	17	5006	20.4%	0.94 [0.48, 1.86]
SPARCL 2006	55	2365	33	2366	39.5%	1.67 [1.09, 2.56]
Total (95% CI)		**31099**		**31105**	**100.0%**	**1.53 [1.16, 2.01]**
Total events	127		83			

Heterogeneity: $\chi^2 = 10.01$, df = 6 (P = 0.12); $I^2 = 40\%$

Test for overall effect: $Z = 3.02$ (P = 0.002)



~ Increased risk of ICH in subjects with higher dose of statin therapy.

Acta Neurol Scand. 2016;134:22-8.

Other Lipid-lowering Drugs For Stroke Prevention

- Hypertriglyceridemia increases stroke risk.
- HDL-C level is strongly inversely associated with cardiovascular disease from observational studies

- However, a meta-analysis showed there was no significant effect on stroke outcomes for **niacin** (OR=0.96, 95% CI=0.75-1.22, P=0.72), **fibrates** (OR=1.01, 95% CI=0.90-1.13, P=0.84), or **CETP inhibitors** (OR=1.14, 95% CI=0.90-1.45, P=0.29), and on other cardiovascular events.

Keene D, et al. *BMJ* 2014;349:g4379.

Statin in Stroke Prevention Recommendation

- For patients with ischemic stroke or TIA presumed to be of atherosclerotic origin or accompanied with other comorbid ASCVD, intensive statin therapy is recommended. The goal of LDL-C <100 mg/dL is suggested ***(COR I; LOE A)***.

- For patients with stroke or TIA presumed to be of non-atherosclerotic origin and no accompanied with other comorbid ASCVD, the benefit of intensive statin therapy is uncertain ***(COR IIb; LOE C)***.

Recommendation for Ischemic Stroke, TIA and Carotid Stenosis From Taiwan Lipid Guideline

- Statin in Stroke Prevention
- Statin in Acute Stroke
- Statin in Carotid Stenosis

In-hospital Initiation of Lipid-lowering Therapy in Patients with Acute Ischemic Stroke/TIA in Taiwan

- Taiwan Stroke Registry:
  - From 2006/05 to 2008/07, 16704 acute ischemic stroke or TIA patients
  - No previous lipid-lowering therapy, survival to discharge.
  - End-points: recurrent stroke, ischemic heart disease, and death at 6 mon

Multivariate Cox proportional hazards analyses for composite end point at 6 months

Variable	HR	95% CI	p Value
Age (per year)	1.02	1.02–1.03	<0.0001
Diabetes (yes vs no)	1.41	1.25–1.60	<0.0001
National Institutes of Health Stroke Scale score at admission (per 1 unit)	1.05	1.09–1.50	<0.0001
Arial fibrillation (yes vs no)	1.28	1.09–1.50	0.002
LLT at discharge (yes vs no)	0.78	0.61–0.98	0.013

Yeh PS, et al. Am J Cardiol 2010;105:1490-4.

In-hospital Initiation of Statin in Patients with Acute Ischemic Stroke in U.S.

- Patients ≥65 years enrolled in the GWTG-Stroke Registry.
- Two-year follow-up on statin versus not on statin
- During 2007~2011, 77 468 patients who were not taking statin at admission were hospitalized with ischemic stroke
- 71% were discharged on statin therapy.

- Statin therapy
  - Lower cardiovascular events (HR, 0.91; 95%CI, 0.87-0.94)
  - Lower all-cause mortality and readmission.
  - No increased hemorrhagic stroke (HR, 0.94; 95%CI, 0.72-1.23).

***Circulation* 2015;132:1404-13.**

Statin Use in Patients with ICH

- A meta-analysis of 16 studies shows pre-ICH statin use do not increase mortality (OR=0.90, 95% CI=0.63-1.28), and has a better 3-month functional outcome (OR=1.49, 95% CI=1.01-2.19), as compared to pre-ICH no statin use.

Jung JM, et al. *Int J Stroke* 2015; 10:10-7.

- One study from Taiwan's National Health Insurance database showed ICH patients who have taken statins during hospitalization or within 3 months after discharge were associated with lower all-cause mortality and without increased recurrent ICH.

Chen PS, et al. *Eur J Neurol* 2015;22:773-80.

Statin in Acute Ischemic Stroke or TIA Recommendation

- For patients with acute ischemic stroke or TIA, early initiation of statin therapy if indicated is recommended ***(COR IIa; LOE B)***.

- For patients with acute ischemic stroke, hemorrhagic stroke or TIA, discontinuation of pre-stroke statin therapy is not recommended ***(COR III; LOE C)***.

Recommendation for Ischemic Stroke, TIA and Carotid Stenosis From Taiwan Lipid Guideline

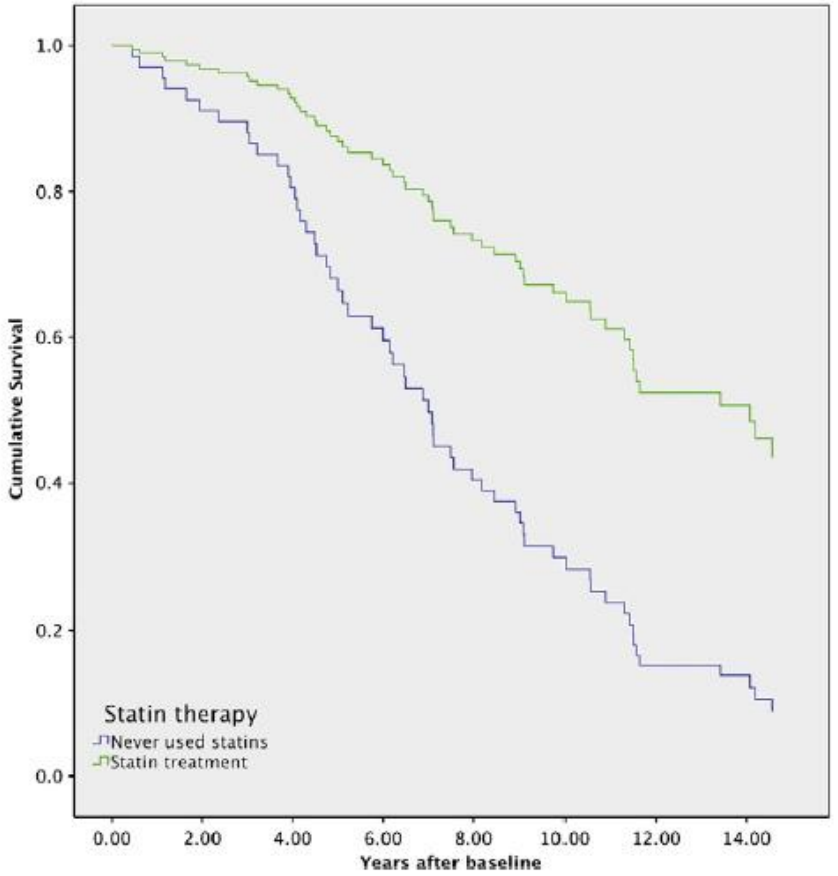
Statins Use in Patients with Carotid Artery Stenosis

- In a review of 17 studies including 11,391 asymptomatic carotid artery stenosis patients, the 5-year all-cause mortality was 23.6%.

Giannopoulos A, et al. Eur J Vasc Endovasc Surg 2015;50:573-82.

- Treatment with statins improved long-term survival in patients with carotid stenosis.

Wörlund SM, et al. *Int J Cardiol* 2013;168:624-6.



Statin in Carotid Stenosis Recommendation

- For patients with symptomatic carotid stenosis (>50%), aggressive medical therapy, including antiplatelets, well BP and lipid control, and risk factor modification, is recommended. The goal of LDL-C <100 mg/dL is highly recommended ***(COR I; LOE A)***.

- For patients with asymptomatic carotid stenosis (>50%) and evidence for other clinical ASCVD, aggressive medical therapy, including antiplatelets, well BP and lipid control, is recommended. The goal of LDL-C <100 mg/dL is recommended ***(COR IIa; LOE B)***.

AHA/ASA Guideline

2018 Guidelines for the Early Management of Patients With Acute Ischemic Stroke

A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association
